

Can You Overdose on Ivermectin? Dr. Pierre Kory's Answer Will Shock You

"One of the safest drugs in history."

🕒 3 min. read

“Of all the harmful misinformation spread over the past couple of years, one of the most disturbing false narratives was targeted at the Nobel-Prize-winning, **human** medicine ivermectin,” expressed filmmaker Mikki Willis in his ground-breaking documentary titled, [*Ivermectin: The Truth*](#).

Ivermectin is “one of the safest and most effective medicines of this era. A medicine that, according to the numerous top scientists I’ve interviewed ... could have ended the pandemic before it began.”

But Ivermectin is “horse dewormer,” the media said. “It could put you in a coma.” “**It can kill you,**” pundits warned.

But is this actually true?

Popular podcaster Greg Hunter, AKA [USA Watchdog](#), asked [Dr. Pierre Kory](#), one of the world's leading experts on Ivermectin, straight-up, "Can I OD (overdose) on Ivermectin if I get two or three times the [standard] dose. Can I kill myself?"

Dr. Kory's answer blew Greg Hunter's mind.

"Let me answer scientifically. So there is a world-famous toxicologist named [Jacques Descotes](#), and he's French. And two years ago, he was commissioned to do a scoping review of the entire data on the safety of Ivermectin in its history. And his conclusion after doing this

comprehensive review is that **he does not believe that there has been one single case of anyone dying from an Ivermectin overdose.**”

“Oh, Lord,” reacted Greg Hunter. “How many pills have been given worldwide? I heard 4 billion, but it must be more than that.”

“Over 4 billion,” [Dr. Kory](#) confirmed. “Now, people have died where the deaths were reported as caused by Ivermectin. But when he [[Prof. Jacques Descotes](#)] reviewed those cases, he didn't think those arguments [were] credible.”

Let's dive deeper into [Prof. Descotes'](#) analysis.

The screenshot shows a BusinessWire article from March 05, 2021. The article title is "Covid-19: MedinCell Publishes an Extensive Ivermectin Safety Expert Analysis". The article is dated March 05, 2021, 11:45 AM Eastern Standard Time. The location is Montpellier, France. The article is categorized as "Regulatory News". The main text states: "Publications over the last few months show a significant body of clinical data and scientific knowledge supporting the efficacy of ivermectin at therapeutic dose against Covid-19, for both curative and prophylactic purpose". A quote from MedinCell (Paris MEDCL) says: "No safety concern is anticipated that would prevent health authorities from assessing the use of Ivermectin against Covid-19 as a new indication". The article also mentions: "The expert review written by a prominent toxicologist is an assessment of ivermectin medical safety profile". At the bottom, it states: "It is based on an extensive analysis of over 350 articles plus clearly identified and accessible web sources". The article includes a "Tweet this" button and a "More News" section with a date of August 02, 2023, and a link to "MedinCell's Partner Teva Announces Successful Launch of UZEDY™".

But first, a quick look at his impressive credentials. “[Pr. Jacques Descotes](#), MD, PharmD, PhD, Professor Emeritus, Claude Bernard University of Lyon (France), [is] a world-known toxicologist with a 40-year track [record] as an independent consultant for the pharmaceutical industry as well as an advisor to regulatory bodies worldwide,” [BusinessWire](#) wrote.

In March 2021, he conducted a review of Ivermectin’s safety profile based on over 350 articles - plus accessible web sources. Here are his conclusions:

"Ivermectin has been administered orally to hundreds of millions of people throughout the world in the past three decades. The assessment of reported adverse events temporally associated with Ivermectin exposure shows that Ivermectin-induced adverse effects have so far been infrequent and usually mild to moderate.

"It is noteworthy that **no deaths have seemingly ever been reported after an accidental or suicidal overdose of Ivermectin.** No greater

toxicity of Ivermectin has been substantiated in elderly people despite repeated assertions that an ageing blood-brain barrier might lead to increased Ivermectin toxicity level. The positive clinical experience accumulated with Ivermectin administration led many medical experts to break away from early adamant contra-indications in pregnant women. Finally, several national pharmacovigilance networks around the world released information and opinions to ascertain Ivermectin safety in human subjects. So far, there are no critical safety limitations to Ivermectin prescription in current indications.

I also want to point out that **no severe adverse event has been reported** in dozens of completed or ongoing studies involving thousands of participants worldwide to evaluate the efficacy of Ivermectin against COVID-19."

Astonishing. So what would it take to overdose on Ivermectin?

"In order to overdose from Ivermectin, you have to take either a hundred or a thousand times the standard dose," declared [Dr. Kory](#).

“And there have been accidental poisonings where people have taken large amounts. But you know what happens every time? When they take these massive amounts of Ivermectin, it tends to affect them neurologically. They'll get confused. They might be stumbling — uncoordinated. They go to the hospital, and there's no treatment required. But within days, the patients return to normal. So, there's been no life-ending injuries. No deaths reported with Ivermectin. So, that shows you why it's **one of the safest drugs in history**, even at massive overdoses.

Greg Hunter's [full interview](#) with Dr. Pierre Kory is available to watch in the video below.
